

TRAWL LIGHTS

Guide Fish Out of the Net!

Lights for fishing have been around for a long time in all shapes and sizes and they are used for many applications, but primarily they have been used to attract fish to the boat or the net. WESMAR's new trawl lights are designed to guide fish OUT of the net.

During an observation charter on a trawler in Alaskan waters it was noted that the recapture bag with the camera lights shining on it had more salmon than the non-lit bag, leading to speculation by some that shining lights on the escape hole had value.

The Right Size and Weight

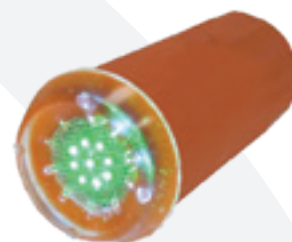

Extra size and weight on the net are a problem so the challenge for WESMAR was to build lights that are small and lightweight yet very rugged.

Stainless Steel Carriers

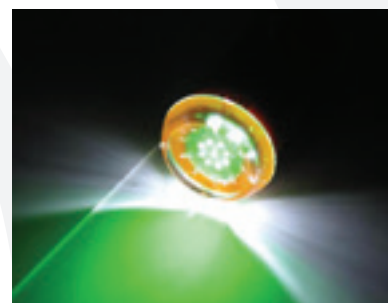

WESMAR knows about the challenges of weight and size because of our catch sensors, considered the most rugged in the industry, yet the lightest of weight. Using this knowledge we designed a trawl light that slips into a WESMAR stainless steel carrier. They attach to the net and are lit with a long-life battery.

Trawl light inside of its stainless steel carrier – ready to mount.

Trawl light outside of its stainless steel carrier.
